

Who can do what, on Velaivaaipu

Nine account types share one job portal — some post jobs, some apply to them, some run a campus, one runs the platform. This is the map of what each one can actually reach: **routes**, **navigation**, and the **gates** — role checks, delegated permissions, and paid-plan features — that stand in front of them.

● Platform

● Talent

● Employer

● Institution

Overview matrix

Every role at a glance — where it lands after login, how much of the sidebar it fills, and the one thing most worth knowing about how its access is bounded.

ROLE	LANDS AT	CORE NAV	PREMIUM NAV	BOUNDED BY
● Admin	/admin	12 items	— (ungated)	Nothing — full platform authority
● Subadmin	/subadmin	0 items	0 items	Effectively everything — see Notes
● Jobseeker	/jobseeker	11 items	8 items	Subscription plan (mostly internal, one gated)
● Company	/company	10 items	6 items	Subscription plan only — owns the tea
● Recruiter (solo)	/company	9 items	5 items	Subscription plan only
● Recruiter (team-managed)	/company	≤9 items	≤5 items	Company's plan <i>and</i> whatever permissions the owner checked off

ROLE	LANDS AT	CORE NAV	PREMIUM NAV	BOUNDED BY
● Org Employee	/employee	9 items	5 items	Company's plan only — never permissi filtered
● College (TPO)	/college	10 items	2 items	Subscription plan — also reaches empl routes off-nav
● Drive In-charge	/incharge	1 item	0 items	Scoped to the specific drive(s) they wei invited to

The hiring pipeline, role by role

One job, moving through the system — and where each role touches it. Talent and Institution feed candidates in from two directions; Employer is the only lane that turns an application into a hire; Platform doesn't sit in the flow at all — it watches the whole thing.

What this shows: a job moves through one Employer-lane pipeline regardless of whether the candidate arrived by browsing the open job board (Talent lane) or through a college's campus drive (Institution lane) — both funnels converge at *Applies*. Admin isn't a fourth stop in the flow; it verifies the College and moderates the Job Listing that make the flow trustworthy in the first place, and separately reconciles the Payments the plan gates below run on.

Platform runs the marketplace

● Admin

/admin

Full platform authority. The only role whose access **isn't** checked against a subscription plan — every **FeatureGate** in the app treats admin as pre-unlocked.

MANAGES

User accounts

Job inventory

College KYC

Subscription plans

Buyers

Pay-per-feature

Coupons

Requests

Payment history

Messages

Tickets

Reviews

Can block, verify, delete, or extend the subscription of any user; delete companies and jobs outright. No **FeatureGate** or **teamPermissions** check ever applies to this role.

● Subadmin

/subadmin

Modeled as a content-moderator tier (job & user moderation), sitting one step under Admin.

CAN REACH TODAY

 **Static dashboard only**

Every admin-panel route requires the exact role **admin** — subadmin is excluded, not narrowed. See [Notes & gaps](#) for the full picture; this one is worth reading before assigning the role to anyone.

Talent looking for work

● Jobseeker

/jobseeker

Browses and applies to jobs, tracks applications, and can link to a college to join its campus drives.

 Direct Messages

Only **Direct Messages** is hard-blocked at the route (`hasMessageRecruiters`) if the plan lacks it — the rest of the premium row is shown regardless and self-limits by internal usage counters. Free tier already includes Resume Builder, monthly Job Alerts, Direct Messages, and Career Counselling at baseline.

Employer hiring, alone or as a team

● Company

/company

The team **owner**. Only role that can invite recruiters, hand out **teamPermissions**, and see incoming campus-drive requests.

Drive Requests

Free tier: 2 active job postings, 10 candidate searches/day, 1 seat, Basic profile — ATS, analytics, and bulk messaging all require a paid plan.

● Recruiter — solo

/company

Runs their own company profile independently — same feature set as Company, minus the team-ownership tools.

No **My Team** — that page is Company-only. A solo recruiter who later joins someone else's team becomes the next card.

● Recruiter — team-managed /company

A recruiter delegated onto **someone else's** company team. Same account type as solo — narrowed entirely by what the owner checks off.

CORE ACCESS

My Team — read-only

whichever of My Jobs / Post Job / Find Candidates / Requests the owner granted

PLAN-GATED — AND PERMISSION-GATED

ATS Pipeline

Analytics

Bulk Messaging

Video Interview

Differs from solo recruiter by: every nav item tied to a `teamPermissions` key disappears unless the owner granted it — see the [three-gate breakdown](#) below. Also loses shared-team access entirely (falls back to solo-style, own-postings-only) the moment their seat goes inactive, e.g. after the owner downgrades the plan.

● Org Employee /employee

Linked to a company as staff, not as a delegated recruiter — a different relationship (`employerCompany`, not `isTeamManaged`) with different rules.

Unlike a team-managed recruiter, **none** of this is filtered by a permissions checklist — every org employee gets the same fixed baseline, gated only by the company's subscription plan.

Institution running campus placement

● College — TPO

/college

Runs campus placement for one institution — and, underneath that, is also a full employer account.

PLAN-GATED

Reports

Messaging

Can post jobs, run ATS, and search candidates through the same routes an Employer uses — those just aren't in *this* sidebar, so a college account reaches them by direct link rather than nav. Cannot open My Team, the team roster, or Drive Requests (owner-only).

● Drive In-charge

/incharge

Not an institution-level role — a delegate for **one or a few specific drives** a TPO invited them to manage.

CORE ACCESS

Manage Drive

Differs from College by: everything is scoped to the invited drive(s) — view detail, export students/companies, move a student's stage, post announcements. Can't create or delete a drive, invite companies, edit the roster beyond stage, or touch MoU/reports; those stay TPO-only. If the invited person already has an account of any kind, they never become this role at all — they just get a bonus **Manage Drive** item layered onto their existing sidebar.

How a team-managed recruiter's access actually narrows

The most layered access rule in the app. A request for a gated page — say, the ATS Pipeline — has to clear three independent checks, in order, and only the middle one is specific to a delegated recruiter.

What this shows: Gate 2 is the only one specific to a delegated recruiter — a Company owner, a solo recruiter, and an Org Employee skip straight from Gate 1 to Gate 3. It's also the gate that's checked client-side only today: most API endpoints behind these pages verify Gate 1 (role) but not Gate 2 (the specific `teamPermissions` key) — see [Notes & gaps](#).

Notes & gaps

Two things worth knowing before this doc is treated as a spec for how access *should* work rather than a description of how it works today.

Subadmin is a stub, not a scoped-down admin

The role is seeded with a moderator's permission set (`moderate_jobs` , `moderate_users`) and every role-redirect map sends it to `/subadmin` expecting a working dashboard there. In the current build, though: the sidebar's menu tables have no `subadmin` entry at all, so a logged-in subadmin sees an empty nav; the entire admin API router requires the exact role `admin` , excluding subadmin from user, job, and company management outright; and the ticket- and review-moderation endpoints use the same exact-match check. The one place subadmin is wired into the backend — coupon management — has no route pointing to it from the UI. Its dashboard page also renders a hardcoded mock list rather than calling any API. Functionally, assigning this role today gives someone a login screen and nothing behind it.

Team-permission gating is UI-level, not defense-in-depth

Gate 2 above — the `teamPermissions` check — runs in the client route guard and in the sidebar's menu filter. Most of the underlying API endpoints a team-managed recruiter's page calls only check **Gate 1** (is the role recruiter/company/org_employee) via `hasCompanyAccess()` , not the specific granted-permission key. That means the page a delegated recruiter can't *navigate* to is still, in most cases, an endpoint their token could call directly. Worth treating as a known gap if any of these permissions are ever meant to be a hard security boundary rather than a UX one.

Compiled from `AppRoutes.jsx`, `Sidebar.jsx`, `ProtectedRoutes.jsx`, and the `admin/college/job` controllers & routers — traced directly against the codebase, not the product spec.
